

28-03-2026

Agenda:

- (1) Scatter
- (2) numpy $\rightarrow$ notion $\rightarrow$ description $\rightarrow$
- (3) self healing

AI, npl based

goal $\rightarrow$ solution of above issue
 $\rightarrow$ flow of coding
 $\rightarrow$ oop

future goals - AI based summary of analytics.

$\rightarrow$ pdf $\rightarrow$ collect
 $\rightarrow$ open $\rightarrow$ pdf
 $\rightarrow$ % of pdf $\rightarrow$

x41 $\rightarrow$ 25%

$\rightarrow$ how much time
user spent in the pdf
 $\rightarrow$ % page

clickstream data →

Clickstream data is the real-time record of a user's activity on a website or app, capturing every click, page view, mouse movement, and scroll behavior in chronological order.

startup → sell something

→ to understand user behavior

project

Base design: (Iteration - 1)

SD-methodology → model
waterfall agile

upload files → save file in database
→ tags
→ description
→ date (optional)

search files → ~~filename~~
tags OR Date
↓
Found → Yes → Chrome / browser render the pdf
↓
view

waterfall (f_1, f_2, f_3, f_4)

linear sequential

agile

→ f_1
→ f_2
→ f_3
→ f_4

Base - design (Iteration - 2)

Implementation

Base - design (Iteration - 3)

✓
pages completed / total pages

open - pdf → Adobe Acrobat

pdf view library → research → xyz library

✓ → pdf → image → storage (simple implement)

problem: pdf to hq image $\rightarrow$ space

Implementation: —

tags:

description:

date (optional)

design decision → db → sqlite

→ db → supabase

→ db → mongodb

Day-2

Agenda:

code implementation

```
>>> a = "hello"  
>>> b = ["he", "ll", "0"]  
>>> c = a.join(b)  
>>> print(c)
```

hehellollhello

["tags like ?" , "lecture date = ?"]

SELECT * FROM documents WHERE

"tags like ?" OR "lecture date = ?" +

unpacking
tuple $\rightarrow (1, 2, 3, 4) \rightarrow$ 1 value $\rightarrow 9$
4 value

"button" → id

"open" → id →
"upload" → id same → X

"open" → id → , key = " "

  open

  open

tag)  date 
 → ↓b → [document]

  →   (url, image)
set → which file

  →
  →  

loading _____
image : _____
files : 0.1^n _____

→ for [0.1^n, 5.1^n, 6.1^n, 2.1^n]

image =  [image_path]

st-column (2)

hospital → prescription → ? , what
